

Survey on Water vs Beverages Consumed by Major and Years at AppState

Nova Doolittle

Clayton-George Reid

Exploratory Analyses

To see if our data was at least logical, we first plotted the linear relationship between water and beverages. The assumption is that, given a finite amount of time in the day, there could be no way to consume, say, 15 cups of water (nearly a gallon) a day and still have time to drink 7 beverages (soda, juice, alcohol, etc.).
